CERTIFICATE OF CORRECTION

PATENT NO. : 7,100,086 B1
APPLICATION NO. : 09/424667
DATED : August 29, 2006
INVENTOR(S) : Kudo et al.

Page 1 of 7

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

Column 17, line 54 thru Column 22, line 10:

Delete claims 1-36 and insert claims 1-36 as shown:

--1. A microcomputer having an on-chip debugging function, comprising:
a central processing unit for executing instructions; and
a first monitor section which performs data transfer to and from a
second monitor section, determines a primitive command to be executed based on the
receive data from said second monitor section, and performs processing for execution of
the determined primitive command, said second monitor section being provided outside
said microcomputer and performing a processing to convert a debugging command into
at least one primitive command in order to reduce the size of an instruction code for
realizing the first monitor section or a scale of the first monitor section, said first
monitor section includes a first frequency division circuit for dividing a first clock and
for generating a first sampling clock for sampling each bit in data sent and received
according to start-stop synchronization, and a circuit for sending and receiving data
based on said first sampling clock, said first monitor section supplies said first clock to
said second monitor section as a signal for causing a second frequency division circuit
included in said second monitor section to generate a second sampling clock.

2. The microcomputer according to claim 1, said primitive command
includes a command for starting an execution of a user program, a command for writing
data to an address on a memory map in a debugging mode and a command for reading
data from the address on said memory map.

3. The microcomputer according to claim 2, the first monitor section
includes a control register used for execution of instructions in said central processing
unit and having an address thereof allocated on the memory map in the debugging
mode.

4. The microcomputer according to claim 2, the first monitor section
includes a monitor RAM into which contents of an internal register of said central
processing unit are saved, and having an address thereof allocated on the memory map
in the debugging mode.

INVENTOR(S) : Kudo et al.

Page 2 of 7

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

5. The microcomputer according to claim 2, further comprising a terminal connected to a single bidirectional communication line for performing a half-duplex bidirectional communication between said terminal and said second monitor section, wherein, on condition that said first monitor section being a slave has received data from said second monitor section being a master, said first monitor section performs a processing corresponding to the received data and sends response data corresponding to the received data to said second monitor section.

6. The microcomputer according to claim 2, the data received from said second monitor section includes an identification data of the primitive command to be executed by said first monitor section.

7. The microcomputer according to claim 2, wherein said first monitor section transfers fixed-length data to and from said second monitor section.

8. The microcomputer according to claim 2, wherein a monitor program for executing a processing of said first monitor section is stored in a ROM.

9. The microcomputer according to claim 2, said first monitor section includes:

a first frequency division circuit for dividing a first clock and for generating a first sampling clock for sampling each bit in data sent and received according to start-stop synchronization; and

a circuit for sending and receiving data based on said first sampling clock, and

wherein said first monitor section supplies said first clock to said second monitor section as a signal for causing a second frequency division circuit included in said second monitor section to generate a second sampling clock.

10. The microcomputer according to claim 2, said first monitor section includes a monitor RAM which is readable and writable, and when a break of an execution of an user program occurs and a mode is shifted to a debugging mode, said first monitor section saves a program counter value of said central processing unit and contents of an internal register into said monitor RAM.

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

11. An electronic instrument, comprising:
a microcomputer according to claim 2;
an input source of data to be processed by said microcomputer; and
an output device for outputting data processed by said microcomputer.
12. The microcomputer according to claim 1, the first monitor section includes a control register used for execution of instructions in said central processing unit and having an address thereof allocated on a memory map in a debugging mode.
13. An electronic instrument, comprising:
a microcomputer according to claim 12;
an input source of data to be processed by said microcomputer; and
an output device for outputting data processed by said microcomputer.
14. The microcomputer according to claim 1, the first monitor section includes a monitor RAM into which contents of an internal register of said central processing unit are saved, and having an address thereof allocated on a memory map in a debugging mode.
15. An electronic instrument, comprising:
a microcomputer according to claim 14;
an input source of data to be processed by said microcomputer; and
an output device for outputting data processed by said microcomputer.
16. The microcomputer according to claim 1, further comprising a terminal connected to a single bidirectional communication line for performing a half-duplex bidirectional communication between said terminal and said second monitor section, wherein, on condition that said first monitor section being a slave has received data from said second monitor section being a master, said first monitor section performs a processing corresponding to the received data and sends response data corresponding to the received data to said second monitor section.

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

17. An electronic instrument, comprising:
a microcomputer according to claim 16;
an input source of data to be processed by said microcomputer; and
an output device for outputting data processed by said microcomputer.
18. The microcomputer according to claim 1, the data received from said second monitor section includes an identification data of the primitive command to be executed by said first monitor section.
19. An electronic instrument, comprising:
a microcomputer according to claim 18;
an input source of data to be processed by said microcomputer; and
an output device for outputting data processed by said microcomputer.
20. The microcomputer according to claim 1, wherein said first monitor section transfers fixed-length data to and from said second monitor section.
21. An electronic instrument, comprising:
a microcomputer according to claim 20;
an input source of data to be processed by said microcomputer; and
an output device for outputting data processed by said microcomputer.
22. The microcomputer according to claim 1, wherein a monitor program for executing a processing of said first monitor section is stored in a ROM.
23. An electronic instrument, comprising:
a microcomputer according to claim 22;
an input source of data to be processed by said microcomputer; and
an output device for outputting data processed by said microcomputer.
24. The microcomputer according to claim 1, said first monitor section includes a monitor RAM which is readable and writable, and when a break of an execution of an user program occurs and a mode is shifted to a debugging mode, said first monitor section saves a program counter value of said central processing unit and contents of an internal register into said monitor RAM.

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

25. An electronic instrument, comprising:
a microcomputer according to claim 24;
an input source of data to be processed by said microcomputer; and
an output device for outputting data processed by said microcomputer.
26. An electronic instrument, comprising:
a microcomputer according to claim 1;
an input source of data to be processed by said microcomputer; and
an output device for outputting data processed by said microcomputer.
27. An electronic instrument, comprising:
a microcomputer according to claim 1;
an input source of data to be processed by said microcomputer;
and
an output device for outputting data processed by said microcomputer.
28. A debugging system for a target system including a microcomputer,
said debugging system comprising:
a second monitor section which performs processing for converting a
debugging command issued by a host system into at least one primitive command; and
a first monitor section which performs data transfer to and from said
second monitor section, determines a primitive command to be executed based on the
receive data from said second monitor section, and performs processing for execution of
the determined primitive command, wherein the second monitor section converts the
debugging command into the primitive command in order to reduce the size of an
instruction code for realizing the first monitor section or a scale of the first monitor
section, said first monitor section includes a first frequency division circuit for dividing
a first clock and for generating a first sampling clock for sampling each bit in
data sent and received according to start-stop synchronization, and a circuit for sending
and receiving data based on said first sampling clock, said first monitor section supplies
said first clock to said second monitor section as a signal for causing a second frequency
division circuit included in said second monitor section to generate a second sampling
clock.

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

29. The debugging system according to claim 28, said primitive command includes a command for starting an execution of a user program, a command for writing data to an address on a memory map in a debugging mode and a command for reading data from the address on said memory map.

30. The debugging system according to claim 28, the first monitor section includes a control register used for execution of instructions in said central processing unit and having an address thereof allocated on a memory map in a debugging mode.

31. The debugging system according to claim 28, the first monitor section includes a monitor RAM into which contents of an internal register of said central processing unit are saved, and having an address thereof allocated on a memory map in a debugging mode.

32. The debugging system according to claim 28, further comprising a terminal connected to a single bidirectional communication line for performing a half-duplex bidirectional communication between said terminal and said second monitor section, wherein, on condition that said first monitor section being a slave has received data from said second monitor section being a master, said first monitor section performs a processing corresponding to the received data and sends response data corresponding to the received data to said second monitor section.

33. The debugging system according to claim 28, the data received from said second monitor section includes an identification data of the primitive command to be executed by said first monitor section.

34. The debugging system according to claim 28, wherein said first monitor section transfers fixed-length data to and from said second monitor section.

35. The debugging system according to claim 28, wherein a monitor program for executing a processing of said first monitor section is stored in a ROM.

Page 7 of 7

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

36. The debugging system according to claim 28, said first monitor section includes:

a first frequency division circuit for dividing a first clock and for generating a first sampling clock for sampling each bit in data sent and received according to start-stop synchronization; and

a circuit for sending and receiving data based on said first sampling clock, and

wherein said first monitor section supplies said first clock to said second monitor section as a signal for causing a second frequency division circuit included in said second monitor section to generate a second sampling clock.--

This certificate supersedes the Certificate of Correction issued June 9, 2009.
